Print() Problems:

Copy the code below into a Python file in Pycharm and follow the instructions:

```
"""

String Concatenation:
1.create a variable and assign it the phrase "hello world" by concatenating the strings "hello" and " world"
2.create a variable and assign it the integer 11
3.create a variable and assign it the integer 38
4.create a variable and use the variables from steps 2 and 3 and string concatenation to assign it the string "1138"

"""

# type your code for "String Concatenation" below this comment and above the one below it.
----------------------------
# -----------------------------------------------------------------------------------------------------------

"""

%s and input():
1.create a variable to hold a user's favorite restaurant (use input() for this.)
2.create a variable to hold the name of a place a user wants to visit.
3.create a variable to hold the user's nickname or first name if they don't have a nickname.
4.use the %s operator to assign the string "Your favorite restaurant is [name of favorite restaurant], you want to visit
 [name of place the user wants to visit], and your nickname or first name is [nickname or first name]" to a variable
5.print that variable

"""

# type your code for "%s and input()" below this comment and above the one below it.
